

01 / Team summary storage flow

The session component owns temporary data. System passes the completed DTO to permanent storage.

«note» Permanent information

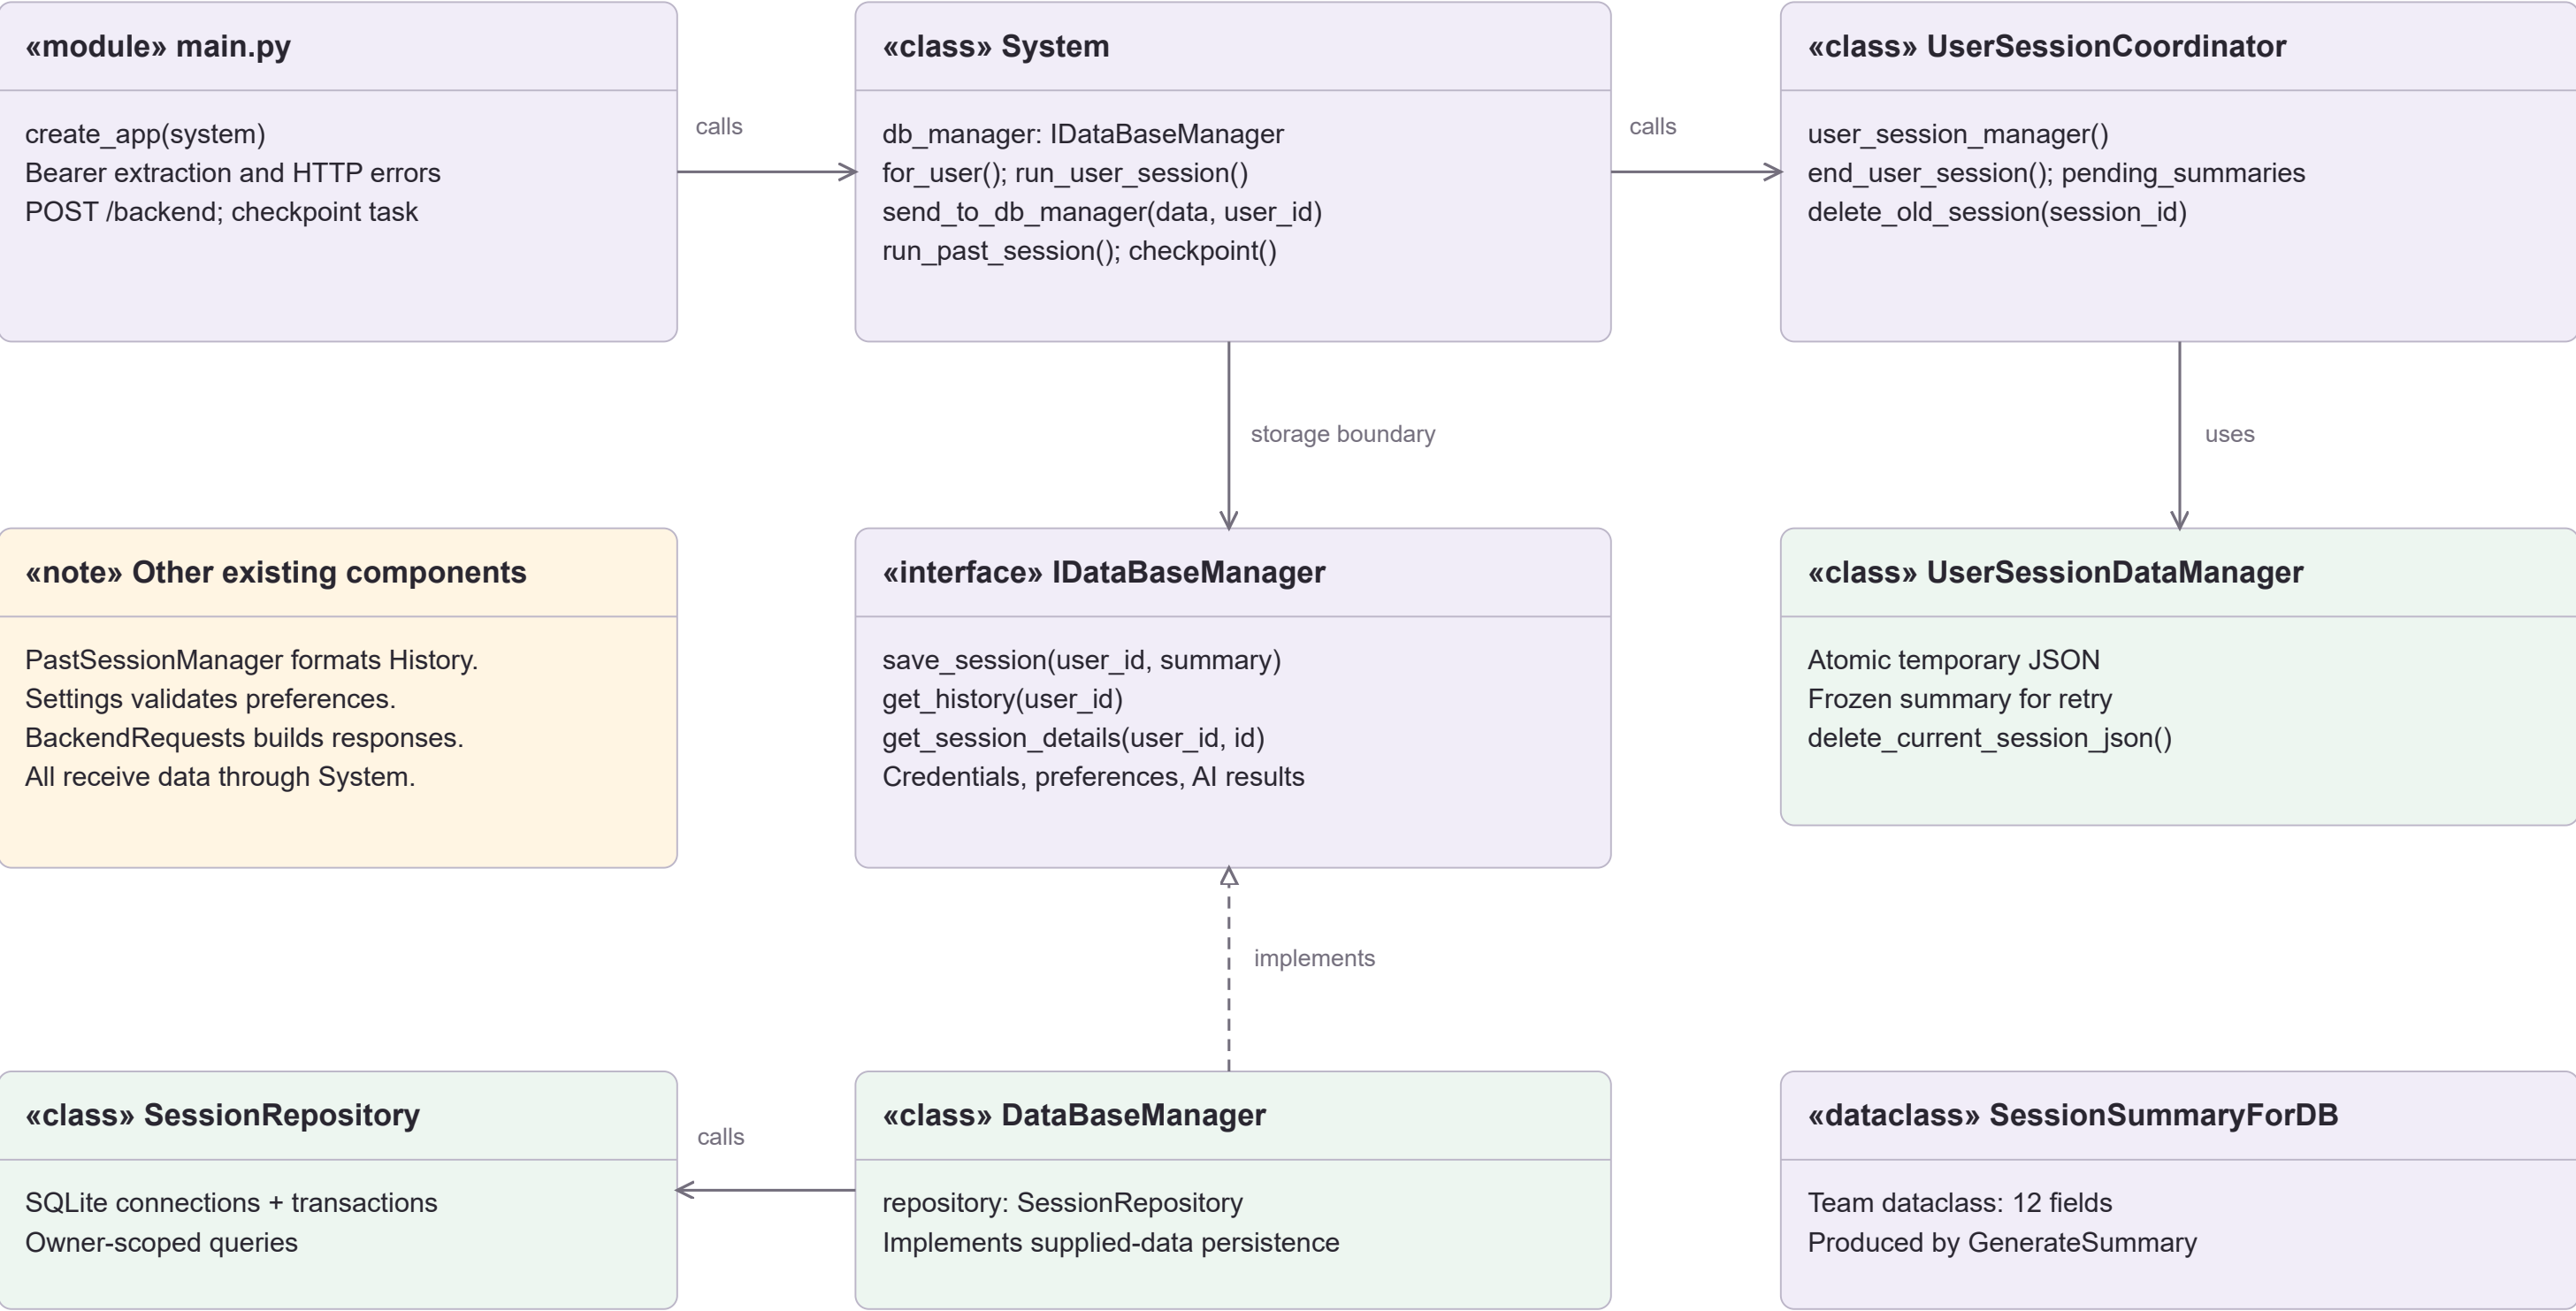

New sessions store exactly the supplied summary fields.
Existing SQL records and their detailed activity remain readable.

«note» No new AI model

Scores/productivity come from the session component.
Optional returned analysis is stored against the original session.

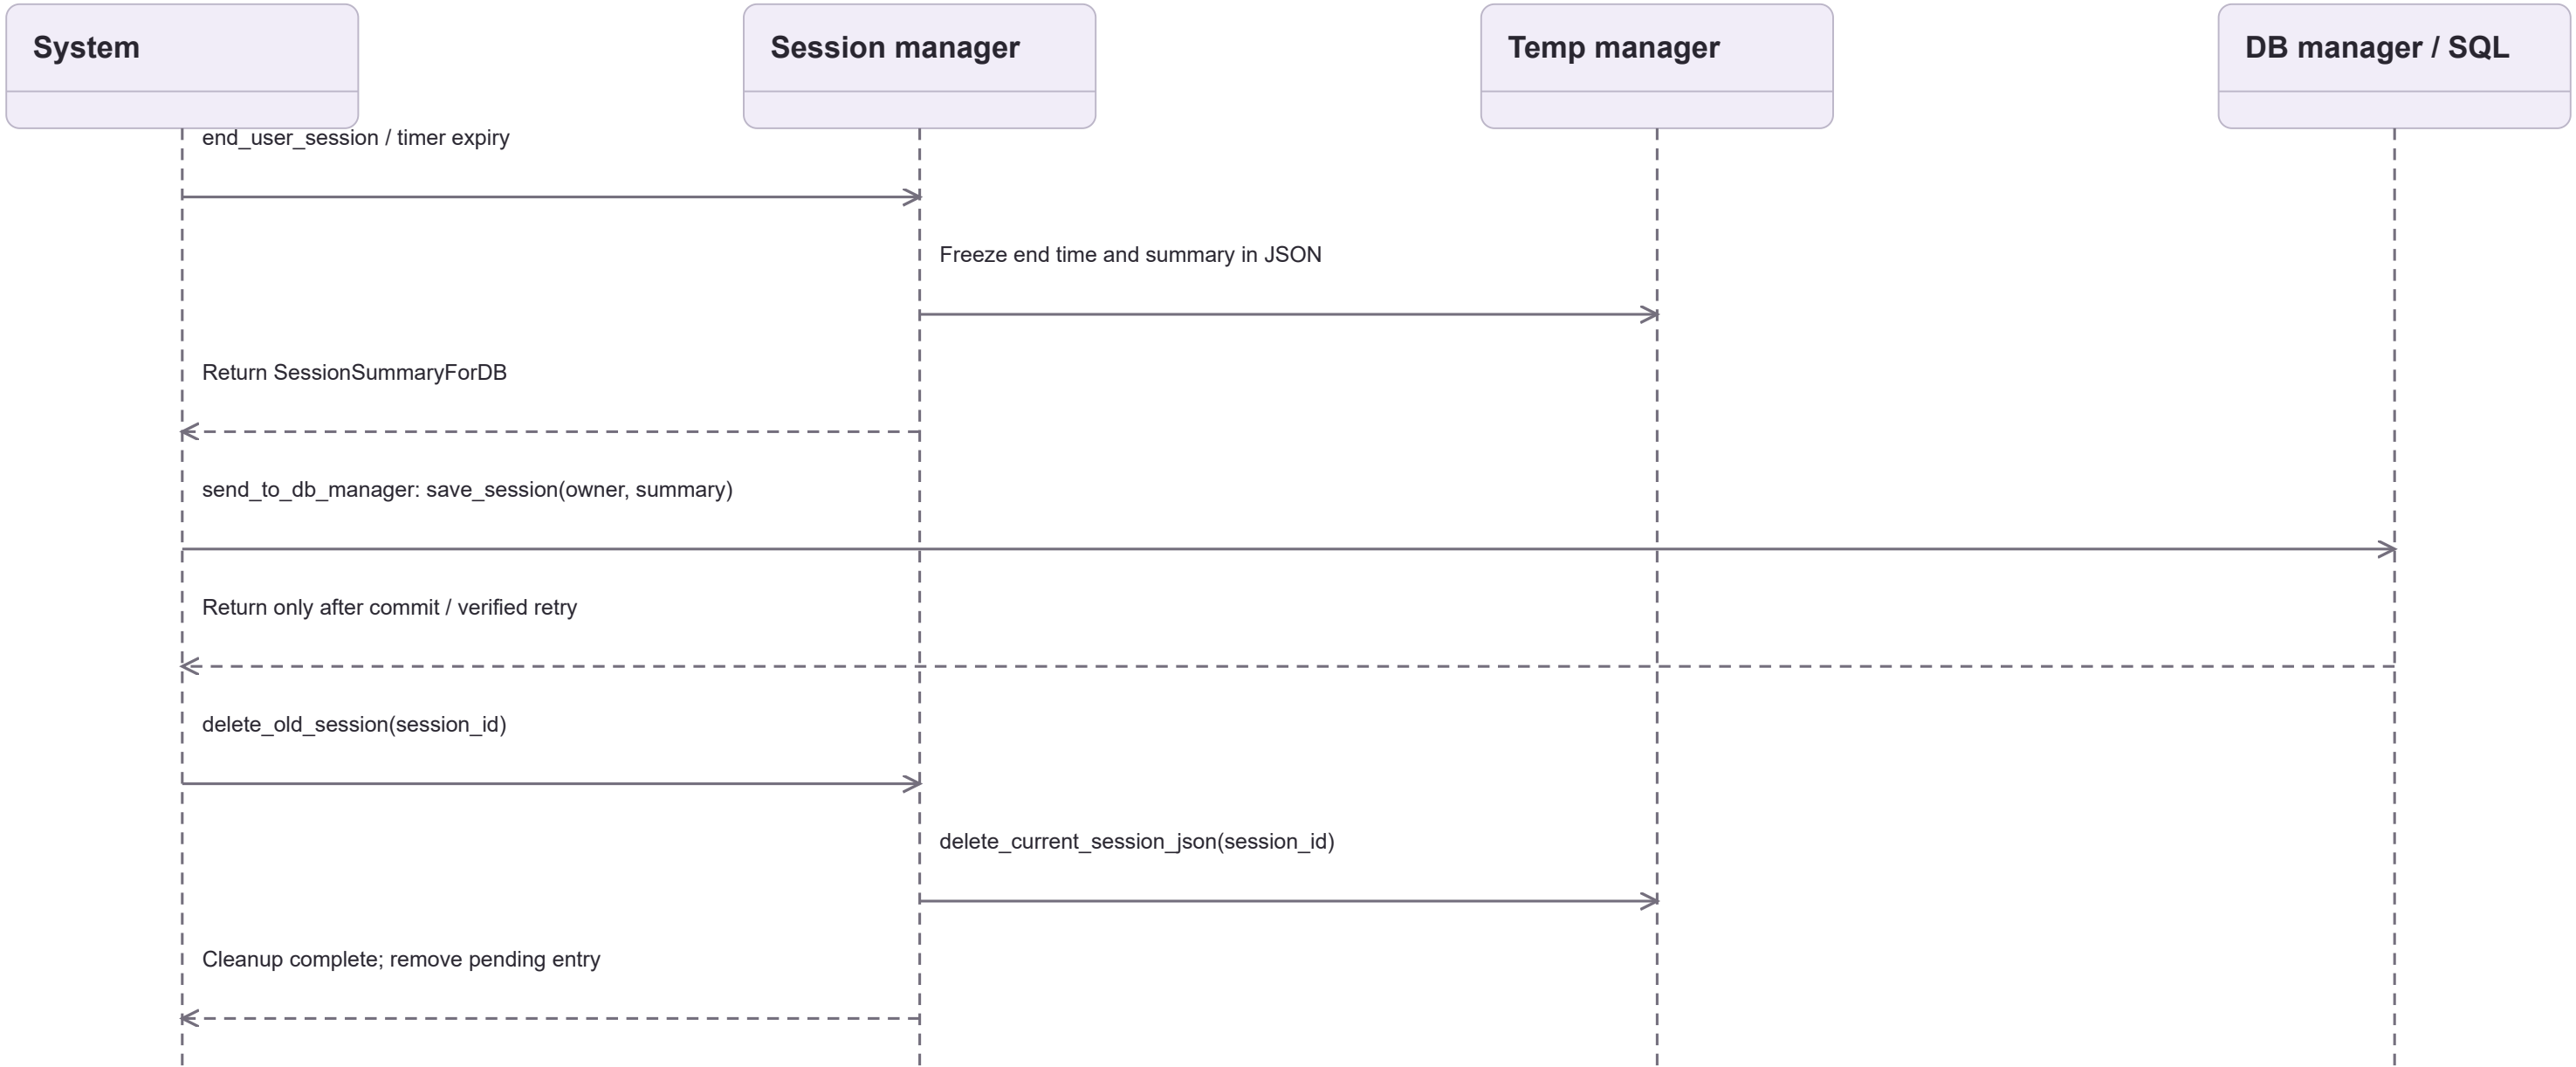

02 / Runtime classes and interfaces

System calls both managers. The database component has no dependency on the session component.

03 / Completion, commit, and cleanup

System coordinates the order; file deletion remains inside the session component.

«note» Database failure

Keep terminal JSON and frozen summary.
Retry via System request/checkpoint/restart.

«note» Cleanup failure

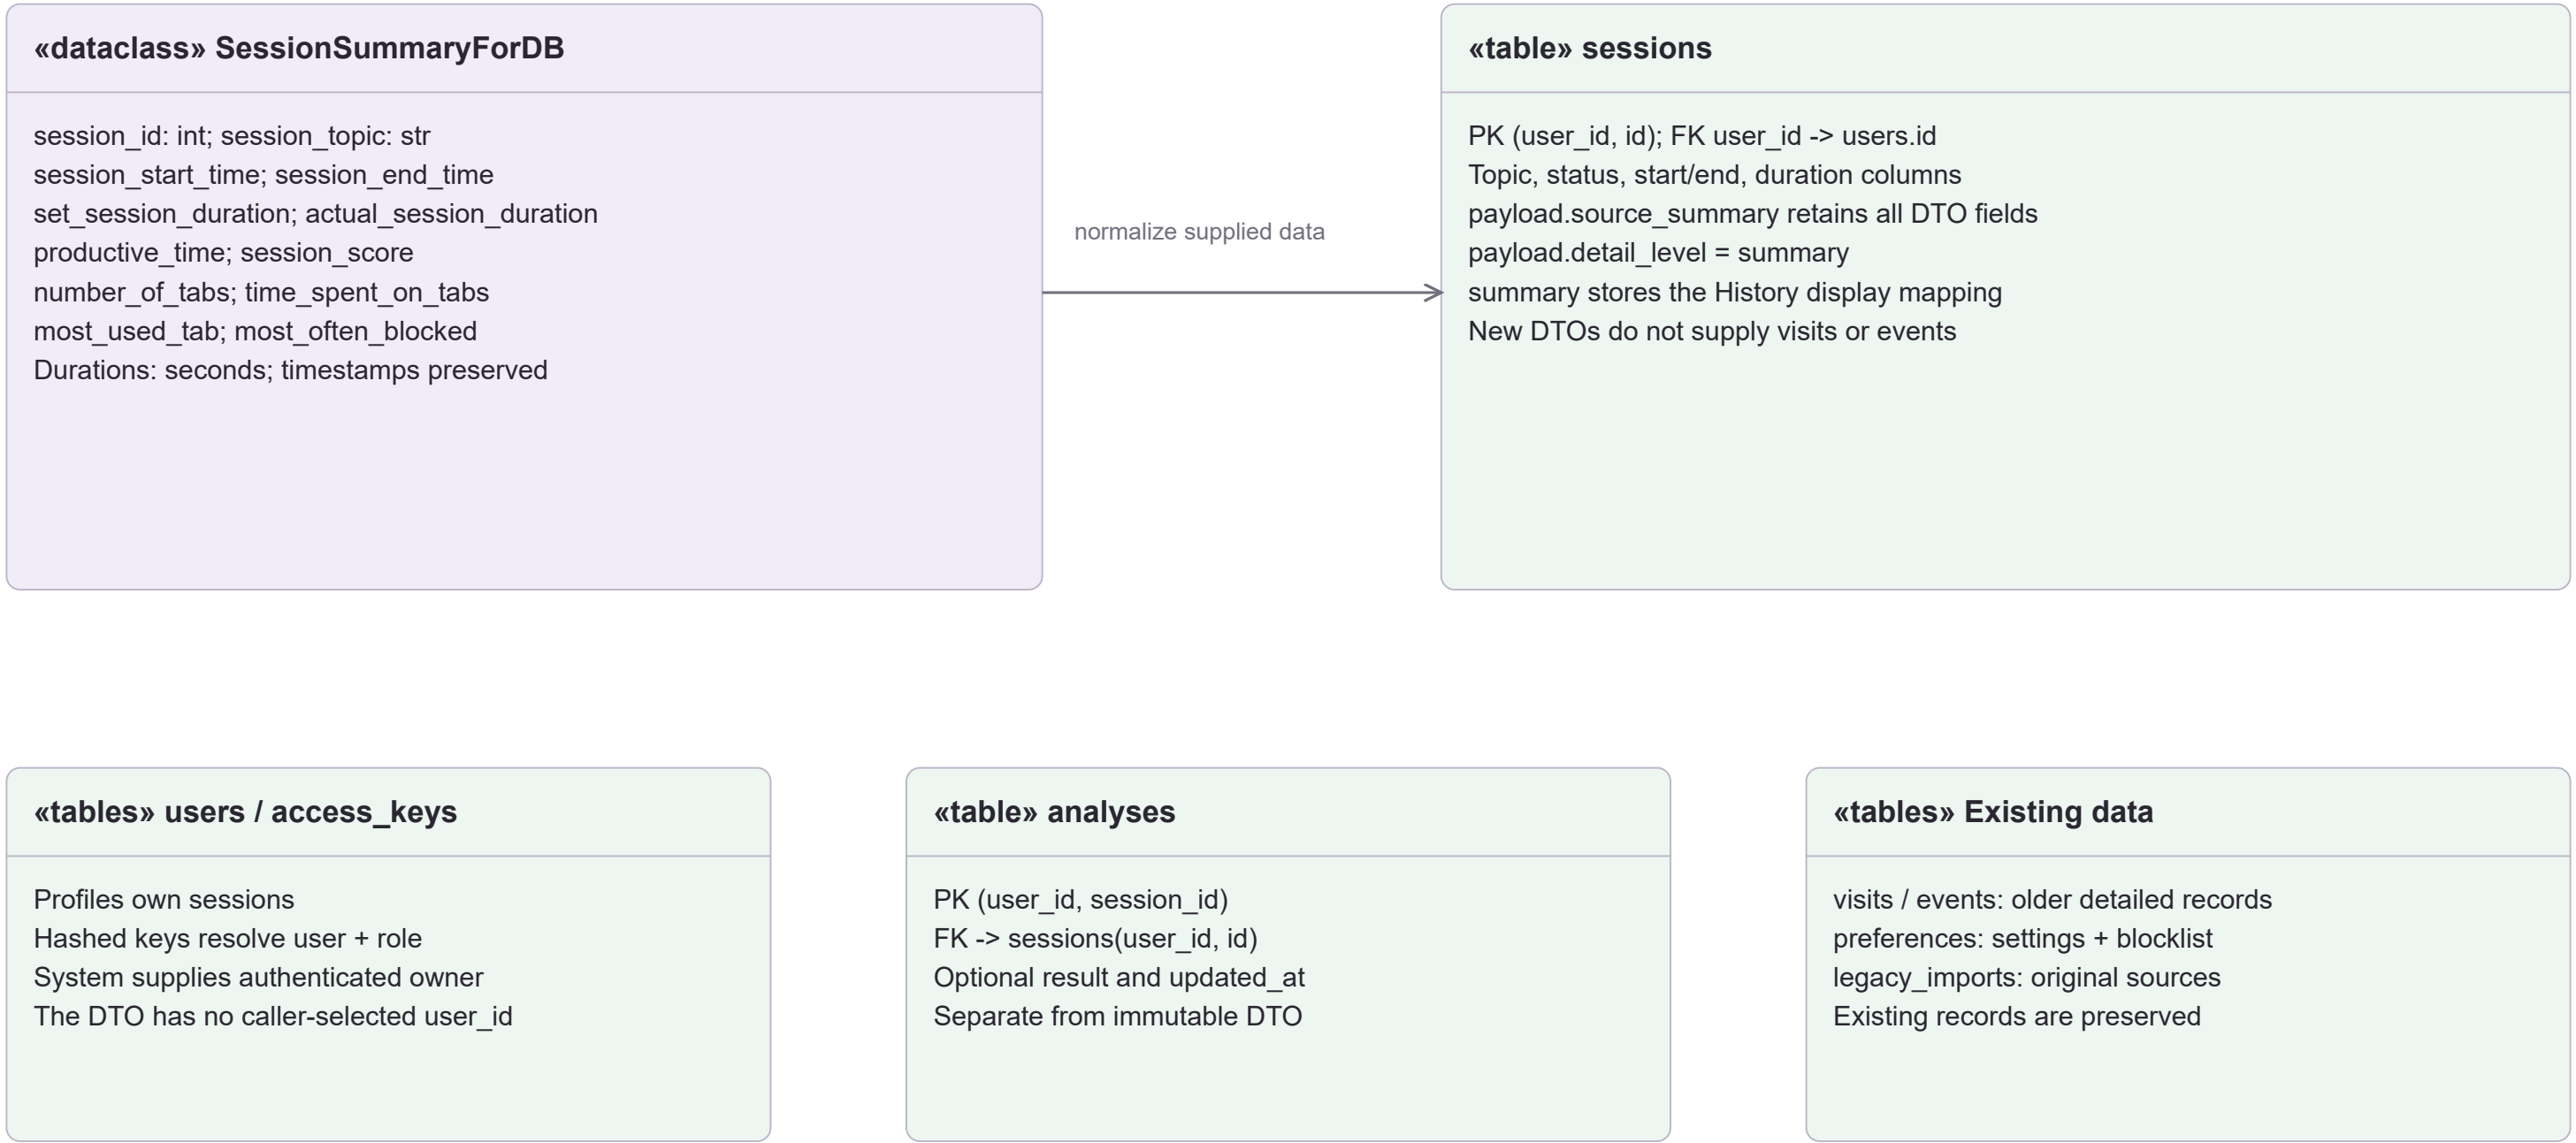

Retry the same summary without duplicating it.
Existing analysis remains attached.

«note» Durable boundary

A later error cannot restore a running session.
Different content with the same ID is rejected.

04 / Persistent data and DTO mapping

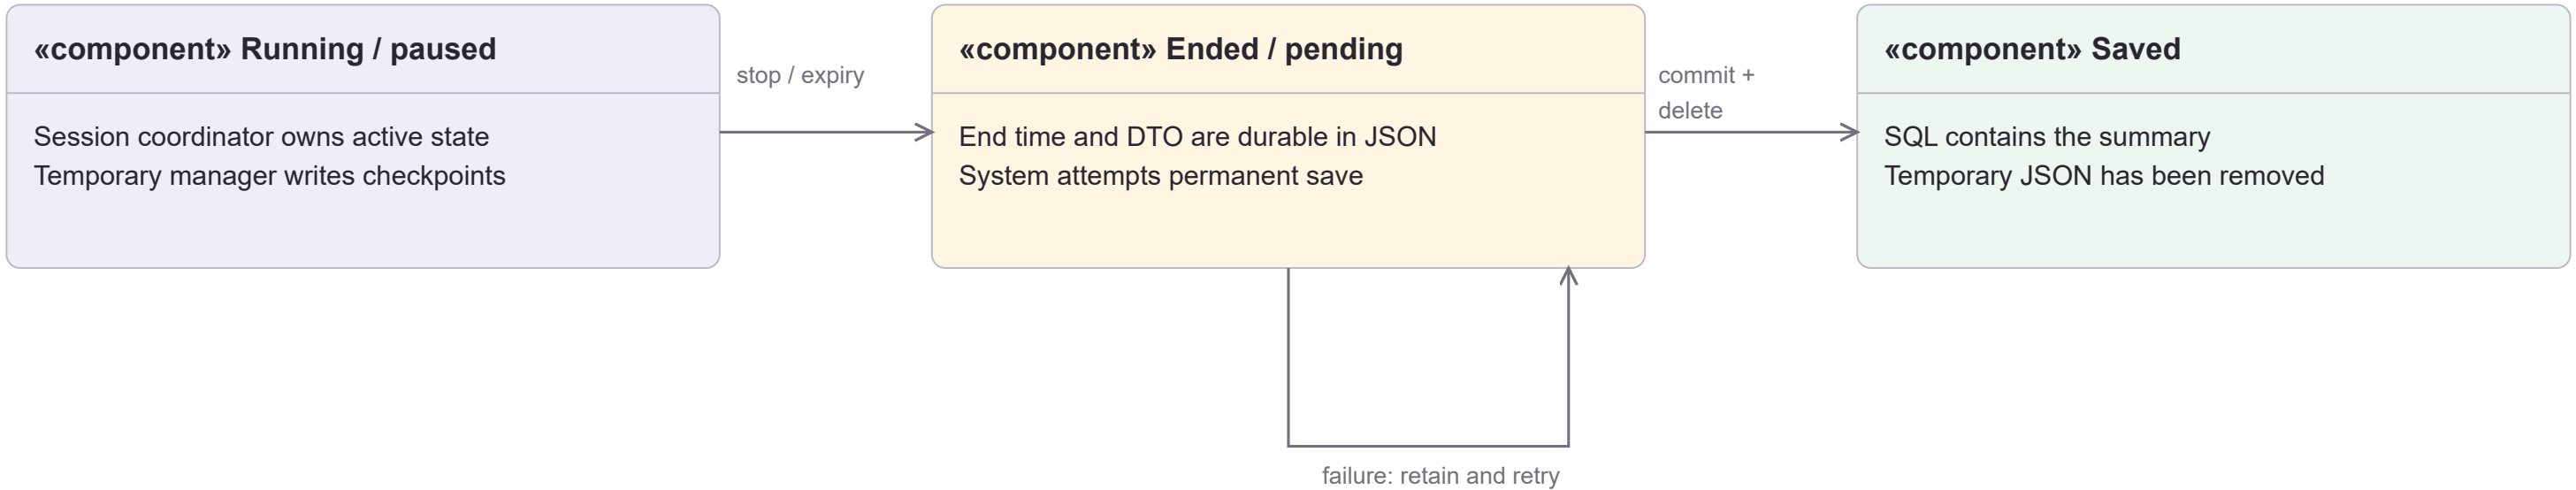

No schema migration is needed. Existing detailed archives stay readable alongside new summary-only records.

Summary-only does not mean zero activity: unavailable visits, pauses, and event details are not invented.

05 / Lifecycle and persistence are separate

The DTO arrives after completion; its storage status can still be pending.

«note» Restart recovery

Pending DTO: replay its frozen values.

Unfinished work: close at the saved checkpoint.

Unknown offline time is excluded.

No guessing of owner from shared legacy files.

«note» Identity and timing

Large integer IDs preserve the team DTO contract.

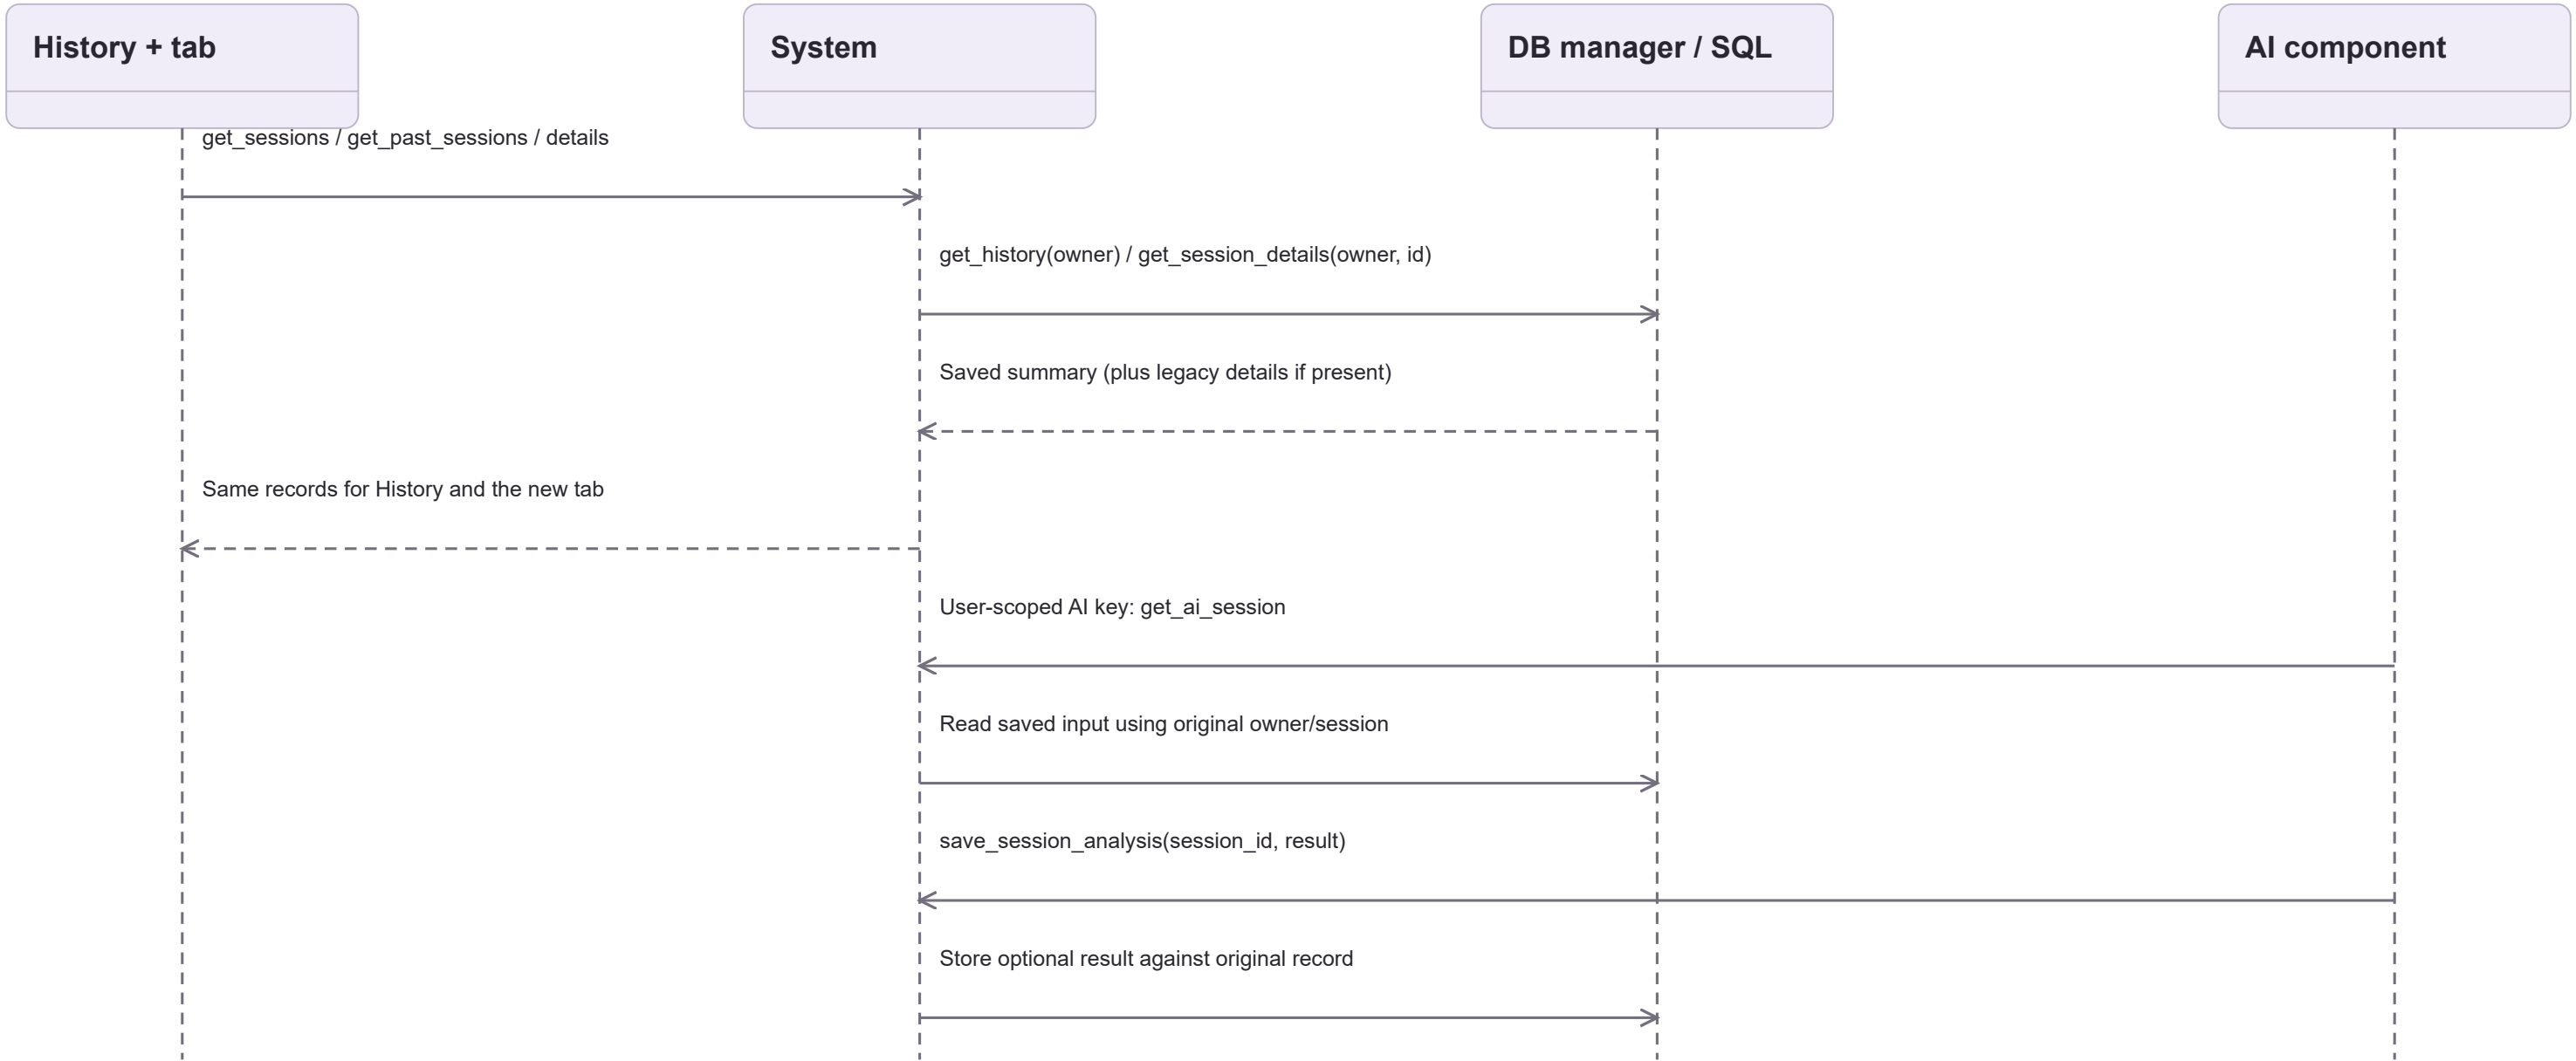

Owner + session ID scopes SQL and retries.

Actual duration follows the team wall-time calculation.

A paused session can have a longer actual duration.

06 / History, dashboard, and analysis

Permanent storage receives and returns data only; every application call goes through System.

«note» Honest presentation

Summary-only records offer summary JSON/CSV.
Detailed visits/events remain available for older archives.

«note» Existing AI workflow

No new model is added. The evaluator is still a stub.
Dashboard remains usable without returned analysis.

07 / Integration and existing data

Integration branch starts directly at the colleague’s StopSession commit bb5b28d.
